Done

Let me read the actual code before proposing changes, since the README says to inspect it first.

Verifying game logic and preparing to test the compiled file.

25_zombie_escape/game.py at main · SETAPESU26/25_zombie_escape (github.com)

Verifying game logic and preparing to test the compiled file.

Done

I have the code. Let me implement all four tasks directly in `game.py`, keeping the existing structure, then test it headless.

Debugging zombie collision and player hit detection logic.

Modified game.py with health, ammo, barrels, zombie types

Headless tests of all four features

Debugging zombie collision and player hit detection logic.

Debug health test failure

Done

That's a test artifact: leftover bullets from the ammo test killed my test zombie. Clearing them:

Ran command, presented file

Rerun tests

Presenting file(s)...

Done

I've implemented all four tasks in `game.py`, keeping your existing classes and structure. I ran a headless test of each feature (HP and invincibility, ammo and reload, barrel blast, all three zombie types spawning), and it all passed. I haven't played it with a real window, so you'll still need to record the before/after videos yourself.

What each task does

- **Health:** The player has 3 HP and `take_hit()` subtracts 1. After a hit there are 90 frames (1.5 s) of invincibility, during which the player flashes white. The game ends only at 0 HP, and the HUD shows 3 boxes for HP.
- **Ammo:** The clip holds 12 bullets. Shooting is blocked while reloading, and the reload starts automatically when the clip hits 0. It uses `pygame.time.get_ticks()`, so it takes exactly 2 s. The HUD shows `AMMO 12/12`, then `RELOAD 1.7s` while reloading.
- **Barrels:** 4 barrels spawn away from the player and from each other. A bullet hit removes the barrel and kills every zombie within 110 px, with an expanding blast animation. Barrel kills count toward kills, score and wave progress.
- **Zombie types:** Fast Zombie (speed 2.8, 1 HP, 20 px) and Tank Zombie (speed 0.8, 6 HP, 44 px), alongside the standard one. Spawns are about 60% standard, 25% fast and 15% tank, so you'll see all three right away in your 10-second video. Damaged zombies show a small health bar.

Changes beyond the four tasks

- **Zombie movement:** `Rect` only stores integers, so the old `int(dx/dist*SPEED)` truncated the 1.5 speed down to 1 px per frame. A Tank at 0.8 would never move at all. Zombies now track a float position, so the standard zombie moves at a true 1.5 (slightly faster than before).
- `Player.shoot`**:** It appended a Rect and then popped it off. I replaced that with a single append.
- **HUD:** The old text line was wider than the 800 px window and got clipped. I removed the controls hint from the HUD to make room for HP and ammo.

Before you submit

- The lab needs your full LLM chat history and says to understand what you submit. Before recording, trace how `update()` orders barrel hits, zombie hits and wave progression.
- Test on your own machine: `pip install pygame-ce`, then `python game.py`. The README's required testing list is worth running through once, especially restarting with R after game over.

Lab 4: VibeCoding
Objective
Use Vibe Coding tools to fix the broken code and add features to the same. Learn how
to prompt to get the job done in under three to four attempts. Clone a repo assigned
to you, make changes and push to your repo in your personal account.
THIS IS AN INDIVIDUAL ASSIGNMENT. WORK INDIVIDUALLY!!
Duration
60 minutes
Software Requirements
● Access to Vibe Coding tool. (ChatGPT, Gemini, Claude etc)
Instructions:

1. Go to the repo assigned to you
2. Go through the ReadMe file to understand the deliverables
3. Clone or Fork the repo
4. Run the Python based code (A game/ A Puzzle)
5. Record 10 seconds of video before making any changes.
6. Write prompts and fix the broken code
7. Write prompts to add all the features listed in the ReadMe file of the repo one
   by one.
8. Record another 10 seconds of video again after making all the changes.
9. Push the code to your repo.
   10.Do not raise PR to the main repo (SETAPESU26)
   Deliverables:
   Upload the following to your Lab repo under Lab-4 folder,
   a. Videos (before and after)

b. Updated Code

c. Chat history exported as a doc/pd

Hunting for a hidden scoring bug in the code.

Hunting for a hidden scoring bug in the code.

Done

The lab also says to fix the broken code. I skipped that step earlier, so I'm checking the original for bugs now.

Ran command, presented file

Fix score overwrite bug and test

Presenting file(s)...

Done

I found and fixed the broken part. In the original, `update()` set `self.score` from the elapsed time on every frame, which wiped out the `+10` for each kill. Kills never counted toward the score. I now keep kill points in a separate `kill_points` counter and add it to the timer, and a headless test confirms a kill scores 10. I should have caught this in my first pass.

The other original problems (zombie movement truncation, the awkward `shoot` code, the clipped HUD) were already fixed in the earlier version.

Order for the lab

1. **Before video:** Record it from the untouched clone, before you copy in my `game.py`. Run `pip install pygame-ce` and `python game.py`.
2. **After video:** Replace `game.py` with the new one, then record about 10 seconds that show:
   - taking a hit and the invincibility flash
   - emptying the clip and the reload countdown
   - shooting a barrel near a group of zombies
   - a Fast and a Tank zombie

3. **Chat history:** The lab requires the complete chat, so use Claude's share link or an export of this whole conversation. I can't export it for you.
4. **Push:** Put the videos, `game.py` and the chat export in a `Lab-4` folder and push to your own repo, not to SETAPESU26. Don't open a PR. I don't have your Lab repo URL, so this assumes you're in a clone of it:

```
mkdir -p Lab-4
cp game.py Lab-4/
git add Lab-4
git commit -m "Lab 4: zombie escape - health, ammo, barrels, zombie types"
git push origin main
```

If you want to go by the "three to four attempts" idea, describe the fix and the four features as separate prompts in your history, one per feature.

9/30/2026, 8:30:49 AM

the code is running and the game is fixed

9/30/2026, 8:39:03 AM

Deciding how to acknowledge the fixed game code.

Deciding how to acknowledge the fixed game code.

Updating memory

Done

Good to hear it's running. You should now have everything needed for the lab:

- the before video, recorded from the untouched clone
- the after video, showing HP and invincibility, the reload, a barrel blast, and the Fast and Tank zombies
- the updated `game.py`
- the full chat export

Put them in `Lab-4` and push to your own repo.

If anything looks off while you record, such as a barrel not exploding or a zombie type not showing up, tell me what you see and I'll dig into it.
